Machine learning

Supervised learning

Machine learning is a subfield of artificial intelligence.

Intuitively We want to *learn from* and *make predictions on* data.

Technically We want to build a model that approximate well (e.g. minimize a loss function) an unknown function.

Application examples

Supervised learning

- Regression

Polynomial $(x, y, z) \rightarrow f(x, y, z)$

House price (surface, nb rooms, city) \rightarrow price

- Classification

Image classification pixel values \rightarrow cat or dog

Text classification list of words \rightarrow spam or valid email

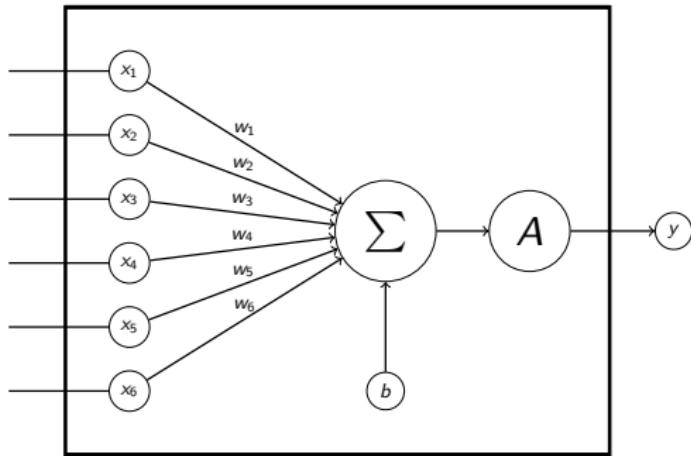

Deep learning

Deep learning is a subfield of machine learning in which we use artificial neural networks to make predictions.

An artificial neural networks is a computation model *loosely* based on the human brain. It aims to mimic electric signals travelling through neurons in order to make computations.

Artificial neural network

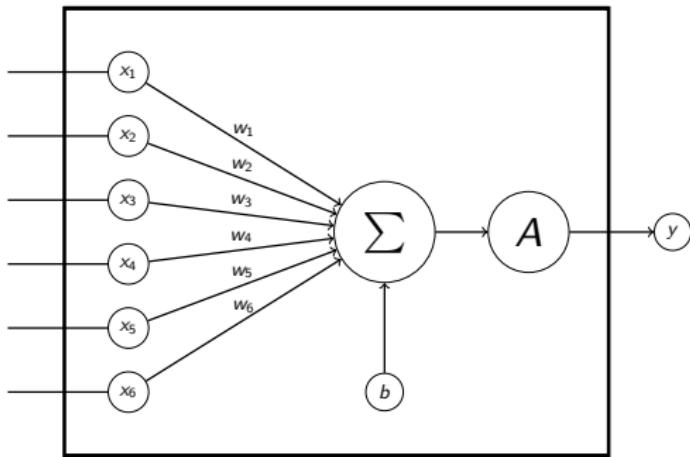

Neuron

$$A(x) = \begin{cases} 0 & \text{if } x < 0 \\ 1 & \text{otherwise} \end{cases}$$

Artificial neural network

Neuron

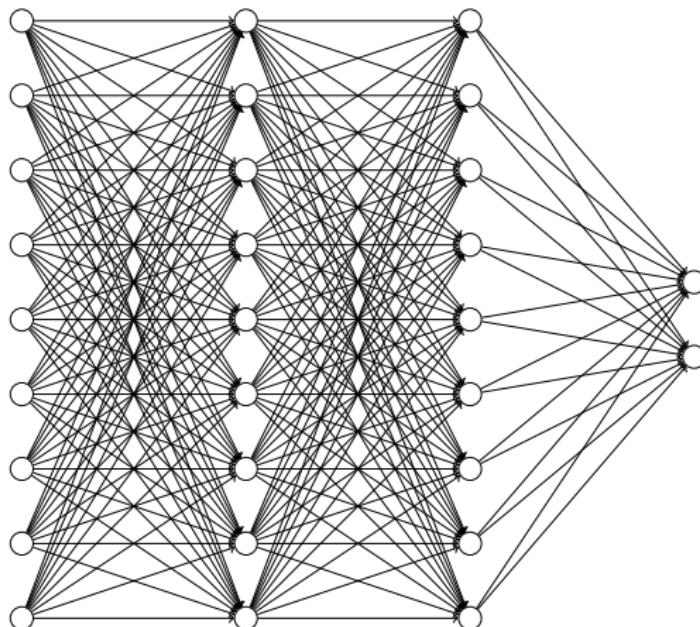

$$A(x) = \begin{cases} 0 & \text{if } x < 0 \\ 1 & \text{otherwise} \end{cases}$$

$$y = A(w_1x_1 + w_2x_2 + w_3x_3 + w_4x_4 + w_5x_5 + w_6x_6 + b)$$

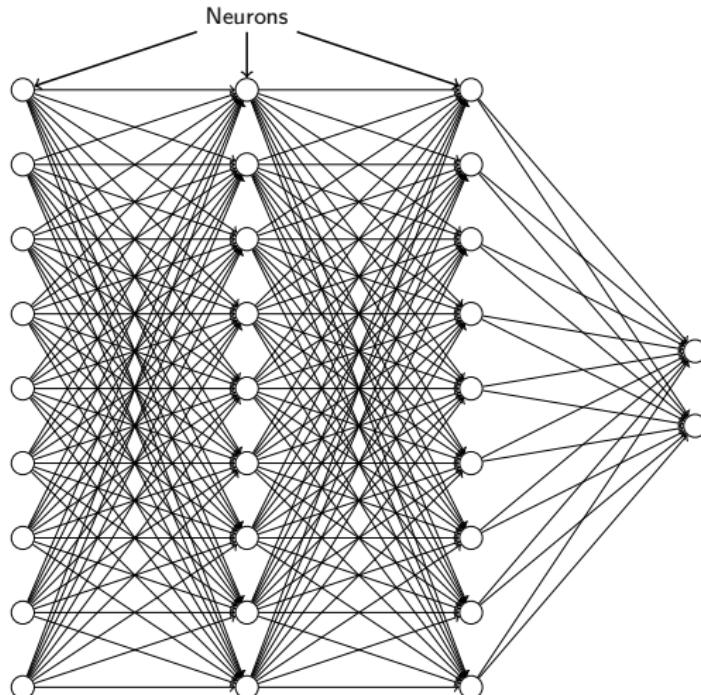

Artificial neural network

Network

Input layer

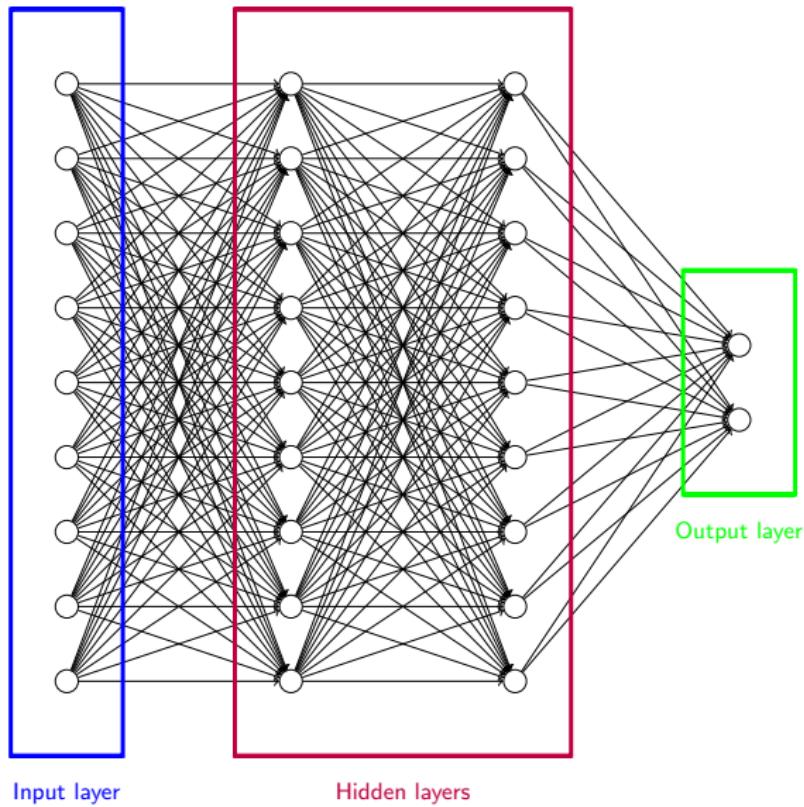

Artificial neural network

Network

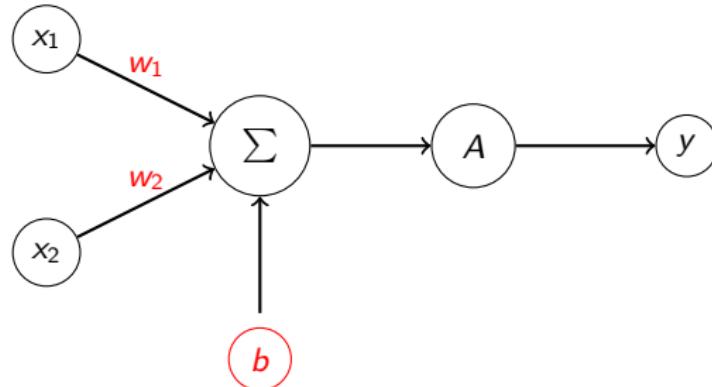

Artificial neural network

Network

Computation example

Binary AND gate

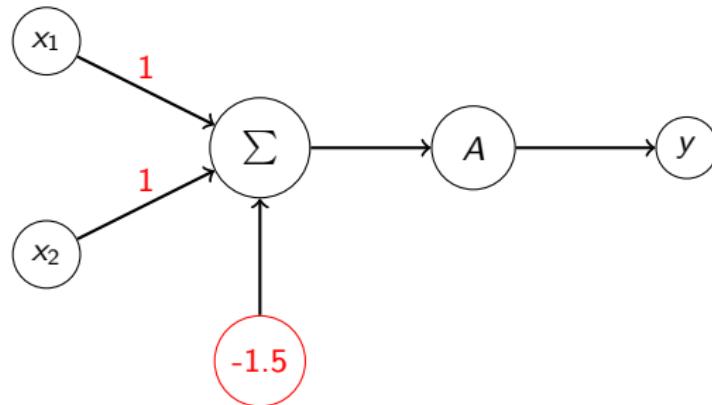

We want to set w_1 , w_2 and b such that:

$$A(w_1x_1 + w_2x_2 + b) = x_1 \text{ AND } x_2$$

Computation example

Binary AND gate

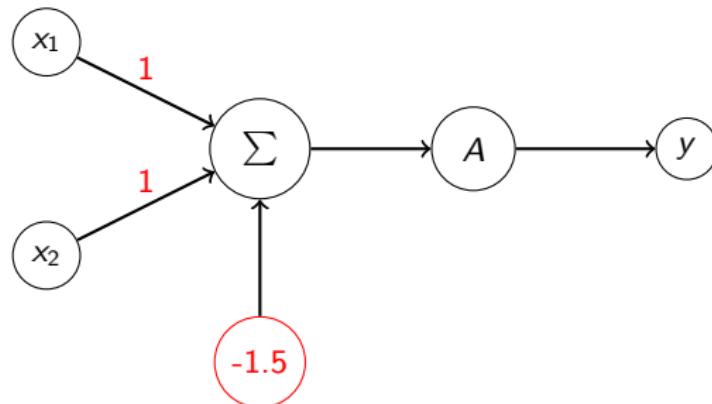

We want to set w_1, w_2 and b such that:

$$A(w_1x_1 + w_2x_2 + b) = x_1 \text{ AND } x_2$$

Computation example

Binary AND gate

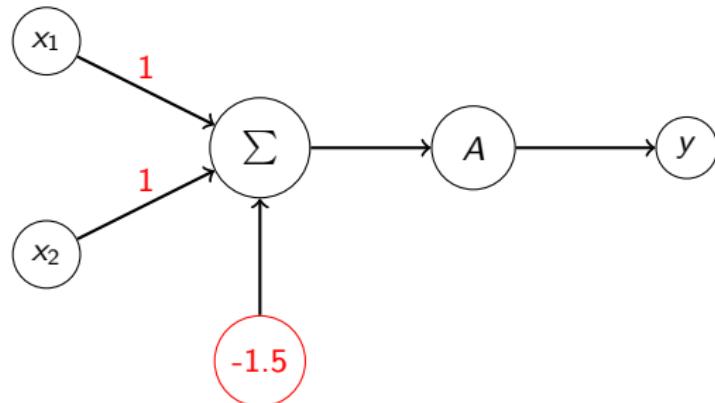

We want to set w_1, w_2 and b such that:

$$A(w_1x_1 + w_2x_2 + b) = x_1 \text{ AND } x_2$$

$$x_0 = 0, x_1 = 1. \quad y = A(0 + 1 - 1.5) = A(-0.5) = 0$$

Computation example

Binary AND gate

We want to set w_1, w_2 and b such that:

$$A(w_1x_1 + w_2x_2 + b) = x_1 \text{ AND } x_2$$

$$x_0 = 0, x_1 = 1. \quad y = A(0 + 1 - 1.5) = A(-0.5) = 0$$

$$x_0 = 1, x_1 = 1. \quad y = A(1 + 1 - 1.5) = A(0.5) = 1$$

Model complexity

One way to measure the complexity of a neural network is its number of parameters.

Model complexity

One way to measure the complexity of a neural network is its number of parameters.

- AND network: 3 parameters

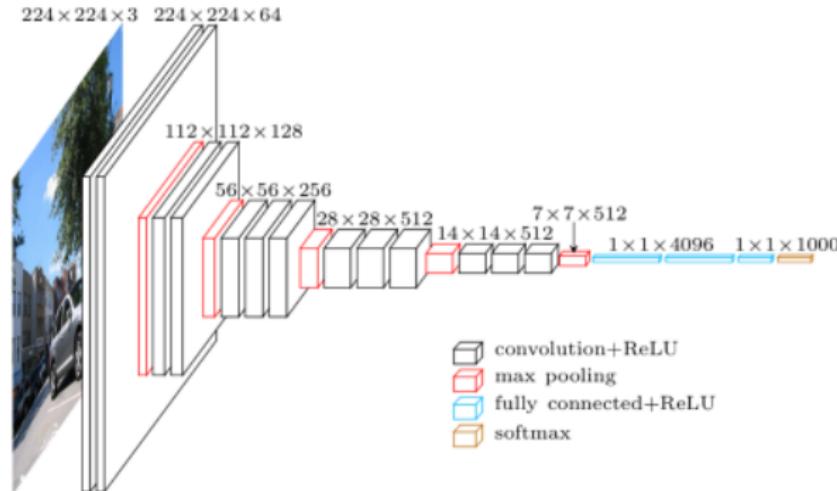

Model complexity

One way to measure the complexity of a neural network is its number of parameters.

- AND network: 3 parameters
- dogs vs cats pictures (VGG16 network): 138,357,544 parameters

Convolutional neural network

VGG network (2014)

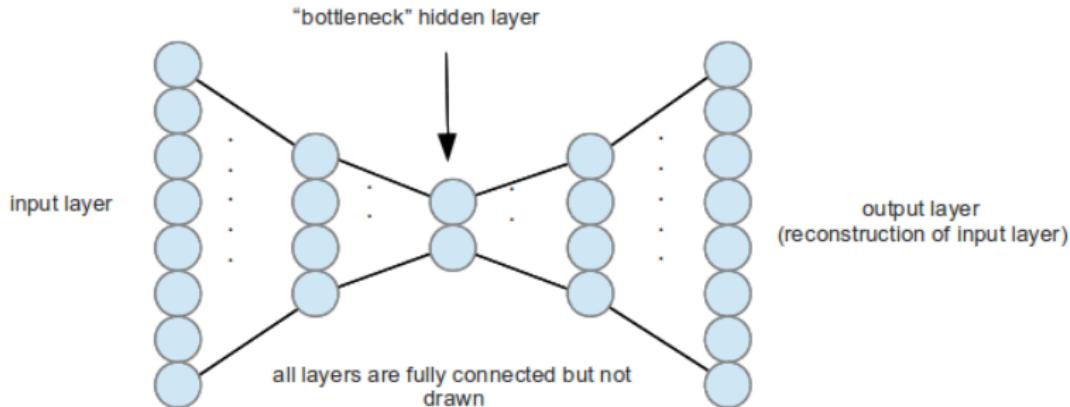

Classify natural images into 1000 categories. (92.7% top-5 accuracy).

Image from <https://www.cs.toronto.edu/~frossard/post/vgg16/>

Simonyan, K., & Zisserman, A. (2014). Very deep convolutional networks for large-scale image recognition. arXiv preprint arXiv:1409.1556.

Architecture examples

Deep autoencoder

If we cut this autoencoder at the bottleneck, we get two parts: an encoder and a decoder. The encoder is an encoder highly specific to the content the network has been trained with.

Hinton, G. E., & Salakhutdinov, R. R. (2006). Reducing the dimensionality of data with neural networks. *science*, 313(5786), 504-507.

Architecture examples

Deep autoencoder: Compression

		bits/px	PSNR	SSIM
UT Zappos50k 11 bits/px				
JPEG2000 16x compression		0.693	19.64	0.705
JPEG 15x compression		0.750	19.90	0.707
NCode(16) 28x compression		0.391	18.82	0.732
NCode(4) 112x compression		0.098	17.14	0.693
NCode(2) 224x compression		0.049	11.13	0.523

If we force the output image to be realistic, we lose *semantic information* rather than resolution.
